Simple Chessboard
Problem Statement:
Write a program that prints a simple chessboard.
Input format:
The first line contains the number of inputs T.
The lines after that contain a different value for size of the chessboard
Output format:
Print a chessboard of dimensions size * size.
Print W for white spaces and B for black spaces.
Sample Input:
3
5
Sample Output:
WBW
BWB
WBW
WBWBW
BWBWB
WBWBW
BWBWB
WBWBW
```

## **Print Our Own Chessboard**

#### **Problem Statement:**

Let's print a chessboard!

Write a program that takes input:

The first line contains T, the number of test cases

Each test case contains an integer N and also the starting character of the chessboard

#### Output Format

Print the chessboard as per the given examples

## Sample Input:

2

2 W 3 B

# Sample Output:

WB

BW

BWB

WBW BWB

```
1 #include <stdio.h>
         int main()
 3 <sub>*</sub>
               int T,d,i,i1,i2,o,z;
 5
6
7
               char c,s;
scanf("%d",&T);
              for (i=0;i<T;i++)
           for (1=0;1:\,\)
{
    scanf("%d %c",&d,&s);
    for (i1=0;i1<d;i1++)
    {
        z=(s=='W')?0:1;
        o=(i1%2=z)?0:1;
        for (i2=0;i2<d;i2-</pre>
10
11 •
12
13
                            for (i2=0;i2<d;i2++)
14
15
16
                         {
    c=(i2%2==o)?'W':'B';
    printf("%c",c);
}
17
18
                            printf("\n");
19
20
21
                     }
22
23
```

Passed all tests! 🗸

## **Pattern Printing**

#### **Problem Statement:**

Decode the logic and print the Pattern that corresponds to given input.

```
If N= 3 then pattern will be:
10203010011012
**4050809
****607
If N= 4, then pattern will be:
1020304017018019020
**50607014015016
****809012013
*****10011
```

Constraints: 2 <= N <= 100

Input Format

First line contains T, the number of test cases, each test case contains a single integer N

## Output Format

First line print Case #i where i is the test case number, In the subsequent line, print the pattern

# Sample Input

3

4 5

# Sample Output

Case #1

10203010011012

\*\*4050809

\*\*\*\*607

# **Armstrong Number**

#### **Problem Statement:**

The k-digit number N is an Armstrong number if and only if the k-th power of each digit sums to N.

Given a positive integer N, return true if and only if it is an Armstrong number.

Note: 1 <= N <= 10^8

**Hint**: 153 is a 3-digit number, and  $153 = 1^3 + 5^3 + 3^3$ .

Sample Input:

162

Sample Output:

true

Sample Input:

123

Sample Output:

false

Sample Input:

1634

Sample Output:

true

## Reverse and Add Until Get a Palindrome

## Problem Statement:

Take a number, reverse it and add it to the original number until the obtained number is a palindrome.

Constraints

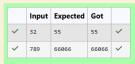

1<=num<=99999999

Sample Input 1 32

Sample Output 1 55

Sample Input 2 789

Sample Output 2 66066

Passed all tests! 🗸

## **Lucky Number**

## Problem Statement:

A number is considered lucky if it contains either 3 or 4 or 3 and 4 both in it. Write a program to print the nth lucky number. Example, 1st lucky number is 3, and 2nd lucky number is 4 and 3rd lucky number is 33 and 4th lucky number is 34 and so on. Note that 13, 40 etc., are not lucky as they have other numbers in it.

The program should accept a number  $\mbox{'}\mbox{n'}$  as input and display the nth lucky number as output.

```
Sample Input 1:
```

3

# Sample Output 1:

33
